Tactix: no-MAB milestone checkpoint

Codex for Andrew

28 September 2026, 02:13 UTC

Decision and outcome. The user retired MAB, asked us to cancel every MAB experiment, and accepted the measured runtime and current status of the four fixed regression sets for the no-MAB version. The current source and tests match the tested no-MAB implementation at `d170b4a5`; MAB/CHB code, configuration, CLI and tests are absent. The separately pinned AE-Kissat-MAB competition baseline and failed immediate-MAB trial remain frozen as historical evidence. No checker route or legal public X7 action changed, and no push was made.

Canceled work. At the direction above, we canceled immediate-MAB Rank/WV100/WV2 checker arrays `1732443/1732445/1732446`, dependent scorers `1732457/1732459/1732461`, and Opus counted fuzz array `1732873`. The B28+C5 checker/scorer had already left the queue; the immediate-MAB full Debug job had already been canceled. The queue now contains no MAB work. The incomplete Opus campaign has no terminal acceptance verdict; its setup and partial artifacts are retained, not promoted.

Four-set evidence. No-MAB Rank 1–50 has 50/50 provisional solves in 7,582.072 solver seconds; its final independent checker remains active. B28+C5 has 33/33 independently checked in 968.588 seconds, within the user-approved 999.876-second ceiling. WV100 has 100/100 provisional solves with one independent checker still active. WV2–89 has 79/89 solves and ten 600-second timeouts. These are the recorded results, not a claim that incomplete checker rows or timeouts passed. The rejected immediate-MAB trial failed all four established gates; its full comparison is in AM525. Fifteen current no-MAB documentation and boundary checks passed. The preexisting pinned no-MAB full Debug suite was revalidated against source and binary hashes and resubmitted as `1732906` for all 188 CTests; its outcome is pending.

Next milestone work. Consume the no-MAB Rank/WV100 checker results and full Debug result; settle the public D2F proof-state reach and general N1/N2 rule verification without changing the canonical no-option DSR route; record any unresolved N3/N4 or winner-rule obligations explicitly. Online learning is deferred. After the milestone is verified under the user's final acceptance contract, submit the full 1,166-instance Tier D Tactix run with 5,000-second, four-CPU, 32-GiB limits, then hand off the next actions. Tier D has not been submitted.

Evidence. `benchmarks/reports/2026-09-28-am525-immediate-mab-all-four-solver-phases.md`; `benchmarks/reports/2026-09-28-am527-retire-mab.md`; `benchmarks/runs/20260927-am519-no-mab-source-authority/manifest.json`; `PROGRESS.md`.
