Tactix session handoff

Codex for Andrew

25 September 2026

Outcome. At the user's request, development stopped promptly because the interactive allocation is nearly over. The source tree was clean at `b49d3b90` before this handoff edit. The last completed repair is the transactional C online-configuration boundary: rejected v1–v3 requests preserve open input, while successful requests still finalize it. Its focused Debug, Release, sanitizer, and six CakeLPR certificate checks are reported in the AM442 technical report. This handoff changes no solver code or proof contract.

Live evidence. Full Debug job 1723391 was still running, with 186/187 tests passed and its final scripted demo active. Paired AES checker array 1723443 had both tasks running on immutable old pins. Neither is a terminal verdict; do not cancel, rerun, or count them complete from this snapshot. The worktree had no unrelated edits. No benchmark data was removed.

Next action and risks. First collect those terminal results and their artifacts. Then repair the general H2 no-option DSR checker-state mismatch without narrowing legal X7 actions; complete affected fuzz and the combined N1–N4, Rank/B28+C5, WV100 and WV2-89 gates. Production online learning still needs session-owned live policy stepping and switchable branching/reduction strategies, followed by a final readiness report. Only after the goal is verified should the requested full Tier D run be submitted at 5,000 seconds, 4 CPUs and 32 GiB on hwulab. The current authorities and exact next step are in `PROGRESS.md`; the AM442 Andrew report carries the implementation detail.
