Codex-Assisted Documentation Review

Tactix Development Project

August 8, 2026

Executive summary

A new Claude skill asks Codex to review Tactix documentation without modifying the repository. Codex must return findings, a complete KEEP/COMPACT/DELETE classification, and a proposed patch. Claude and the user retain approval over every change, with separate approval required for deletions.

1 Findings and results

The skill covers `CLAUDE.md`, `DEVELOPMENT_PLAN.md`, `PROGRESS.md`, the living documents, every tracked `docs/design/*.md`, and the documentation Python scripts. It requires preservation of N1–N4, complete proof-rule contracts, active work, exact defaults, deviations, reopening conditions, and machine-parsed structures.

Design documents and scripts receive exactly one disposition: KEEP, COMPACT, or DELETE. Insufficient evidence means KEEP. A deletion proposal must identify all references, migrate every unique current fact, and update references in the same patch.

The obsolete `tools/docs/archive-log.py` was removed. It served only checkouts predating plan revision 97; current PROGRESS has no narrative Log, and the script was absent from both CTest and wrap-up. The active checkers were retained as stable executable specifications rather than regenerated by agents.

2 Evidence

The new skill is `.claude/skills/codex-revisit-docs/SKILL.md`; it passed the skill-format validator and is below the repository's default skill-size budget. References to the retired archiver were removed from `docs/log/README.md`, `tools/docs/check-progress.py`, and `tools/docs/check-comment-hygiene.`
No checker meta-test or new CTest was added, following Andrew's direction to avoid spending time testing the checker scripts.

3 Risks and decisions

Codex runs with a read-only sandbox and may only propose an `apply_patch` patch. This prevents an external documentation review from overwriting active work. The existing Python checkers remain narrow structural oracles; the skill tells Codex to KEEP or COMPACT an imperfect checker unless its underlying invariant is genuinely obsolete.

4 Next actions

Invoke `codex-revisit-docs` when a documentation audit is desired. Review its evidence and classification before considering the patch. Apply no DELETE disposition without explicit user approval.
