Tactix: terminal fuzz and Debug checkpoint

Codex for Andrew

27 September 2026

Verified outcome. The AM479 bounded DSR deletion spool is pushed in `454e1cbb`; the current-source public D1/H2/D2 controls verify 24/24 complete no-option DSR-to-LSR-to-Trestle chains. The pinned full Debug CTest job `1729972` has now finished, passing 188/188 tests in 14,986 seconds.

Claude Opus completed all 25 counted AM473 jobs on the earlier AM472 source `ab879129`. It found no public-program, Sweep or stock-CLI proof rejection, invalid model, SAT/UNSAT contradiction, crash or sanitizer report. Its 2.95 million internal Proof API rows had zero batch-transaction model failures. The fixed D1/H2/D2 public proofs verified across its tested builds and formats.

Open correctness question. The frozen AM473 affected-scope acceptance was *not met*: 30 internal Proof API rows rejected native DSR because the no-option checker retained a deleted unit or root reason. The same DSR rows fail on the pre-batch pin, so this is not caused by the root-unit batch repair. The current AM476 direct replays also reject, while a public control on the same CNF takes a different verified path. The remaining direct scripts' reachability through legal public actions has not been established. We have not narrowed X7 or changed the canonical checker contract.

Opus also found eight DSR/AUTO versus proofless random-program divergences whose first difference is Lucky's 19 versus 21 enumerated instances. Source inspection confirms that explicit clausal proof mode closes the original-input PBP boundary, hiding startup instances 19 and 20; direct application already declines them before mutation under an unsupported format. This is an N1 action-enumeration question, not an observed SAT/UNSAT contradiction. The separate Rank 1–50 proofless diagnostic remains 50/50 with 25 checked SAT models, but cannot certify its 25 UNSAT outputs.

Next actions. Classify D2F production reach and repair any reachable failure generally; resolve Lucky's proof-mode action enumeration while preserving format capabilities. Then run a fresh Opus campaign on the resulting source and the independently checked automatic-proof Rank/B28+C5, WV100 and WV2-89 gates. N1–N4 and online-learning production readiness remain open. The 1,166-row Tier D run has not been submitted.

Evidence. `benchmarks/reports/2026-09-27-am481-opus-terminal-debug-checkpoint.md`; `benchmarks/runs/20260926-am473-batch-root-claude-fuzz/REPORT.md`; `benchmarks/reports/2026-09-26-am480-public-dsr-replay-after-spool.md`.
