Tactix interim report: transactional online configuration

Codex for Andrew

25 September 2026

Outcome. A rejected online-program configuration no longer closes the C input stream. All three public versions now convert and validate the request, transactionally install it, and only then finalize input. The earlier AM438 audit correctly found the side effect but treated the reorder as unsafe without confirming the variable map: source inspection shows finalization retires absent variables without remapping their literal identities. Accepted requests still finalize before any online step runs. The public header states the new boundary. No proof rule, default schedule, search behavior, or checker contract changed. The detailed evidence is the AM442 technical report under `benchmarks/reports/`.

Validation. New C regressions cover v1, v2 and v3 in proofless, early-LRAT and late-LRAT sessions. They test conversion and executor rejections, nested-payload failures, an unfinished clause, later additions, successful configuration, and the post-success input closure. Five focused API/proof tests pass in both Debug and Release; the two affected ASan+UBSan tests pass with leak detection. Six 10-byte LRAT refutations from the early and late paths independently return `s VERIFIED UNSAT` under pinned CakeLPR and the exact original test CNFs. A deliberately mismatched proof returns no verified verdict, although this checker exits zero on failure. The six retained proofs and two CNFs are in the AM442 technical evidence.

Limitations and next actions. This is an API-lifecycle repair, not a production online learner. Session-owned live DefaultPolicy stepping and owned branching/reduction switches still require staged refactoring. Affected fuzz has not accepted this snapshot. The old-pin full Debug job had passed 186/187 tests with its final scripted demo running, and both extended AES checker tasks were still running; none tests this new snapshot. H2's canonical no-option DSR rejection and the combined N1–N4/performance gates remain open. Finish those gates and the final learning-readiness assessment before launching the requested full Tier D comparison on hwulab.
