Tactix interim proof audit: H2 retained root

Codex for Andrew

25 September 2026

Outcome. The minimized H2 certificate still fails Tactix's canonical, no-option DSR checker. A frozen checker trace now identifies the precise conflict: the checker retains original clause $\neg 18 \vee 19$ after Tactix retires it, derives root unit 19, and then encounters an emitted SR witness that maps 19 to false. The technical evidence and exact commands are in the AM439 report under `benchmarks/reports/`. No solver or checker contract was changed.

Why this matters. Publishing 19 explicitly or dropping the first conflicting witness mapping does not repair the sequence: later SR obligations still conflict with the checker-visible root. We tested successive checker-only witness omissions and observed the failure move to later additions. This does not prove all possible derivations impossible. It does show that a general N2 repair must account for the checker's retained population or use an independently checkable alternative derivation while preserving each legal public X7 action. The separate `-delete-implied-units` mode verifies H2, but earlier archived proofs show that it is not a monotone relaxation. The canonical mode remains unchanged pending a deliberate contract decision and full audit.

Other gates. Claude/Opus has now filed terminal affected-scope PASS reports for the AM401 Reduce-watch, AM412 Lucky-resume, and AM414 C-input boundary repairs. AM401's broader frozen CLI campaign did not meet its coverage/resource criterion, although it reported no new correctness failure. Current-source Debug job 1723391 and the two extended AES proof checks 1723443 were still running at this checkpoint. N1–N4, the general winner PB proof vocabulary, final online-learning readiness, and the post-goal Tier-D comparison remain open.

Next action. Keep the no-option contract fixed while resolving the checker-visible proof-state problem; inspect terminal gate outcomes and run successor validation only on immutable, explicitly specified pins. Do not classify affected-scope fuzz or partial checker jobs as full acceptance.
